

Title

Process multiple connections simultaneously with the password hashing application - Linux environment

Type**Priority****Estimate**

Application		5 - 10 minutes
-------------	--	----------------

Preconditions

1. Linux machine (for example Ubuntu, CentOS).
2. Some prior basic knowledge of Linux and how to navigate via command line.
3. Open multiple Terminals.

Steps**Expected Results**

1	Open Terminal and type the following command, but do not press enter yet. curl -X POST -H "application/json" -d '{"password":"angrymonkey"}' http://127.0.0.1:8088/hash	The command is in the Terminal.
2	Open a second instance of Terminal and type the following command, but do not press enter yet. curl -X POST -H "application/json" -d '{"password":"sweetbanana"}' http://127.0.0.1:8088/hash	The command is in the Terminal.
3	Go to the first Terminal and run the command (See Step 1 above). Then right away, go to the second Terminal and run the command (see Step 2 above).	The command should execute, and you should see a number in carriage return without any errors in both instances of Terminal. For example, 4 or 5 or 6 and so on.

Postconditions

Multiple connections are simultaneously executed.
