

Project

Password hashing application

Issue Type

Bug

Summary

Results aren't displaying in milliseconds

Priority

Minor

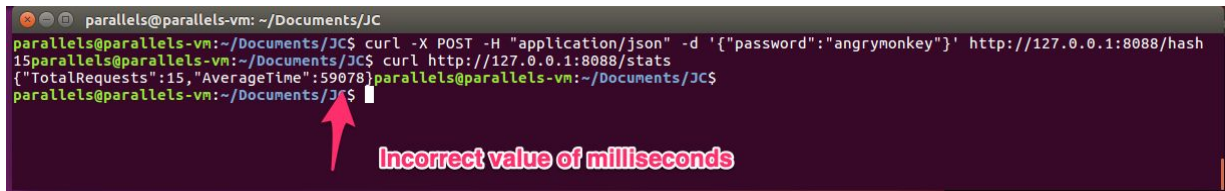

Description

Steps to reproduce:

1. Open Terminal and run the following command:
`curl -X POST -H "application/json" -d '{"password":"angrymonkey"}' http://127.0.0.1:8088/hash`
2. This command above will give you value (a number) in carriage return, five seconds after running the command.
3. Run the following command to get the status, which includes two values: "TotalRequests" and "AverageTime." For example:
`{"TotalRequests":12,"AverageTime":59078}`
4. When you see the "AverageTime," which is in milliseconds, and convert that into seconds, it looks like that response was received after 59.07 seconds. This is incorrect. It did not take 59.07 seconds for the response to display on the screen. It took somewhere between 5-6 seconds.
